

Acknowledgements

It is my pleasure to acknowledge the support of Dr. Kevin Gluck and Dr. Wink Bennett of the Air Force Research Laboratory. Their support allowed me to pursue the research that has become Double R Theory. Without that support, this research would not have been possible. It has also been my pleasure to be a member of the Performance and Learning Models (PALM) research team under the leadership of Kevin Gluck. The support of COL Stuart Rodgers as a Subject Matter Expert and Knowledge Engineer was critical to the success of a project to develop a cognitive model of an Unmanned Aerial Vehicle (UAV) pilot flying basic maneuvers. The UAV pilot basic maneuvering project has now transformed into a project to develop a UAV pilot synthetic teammate in collaboration with Dr. Nancy Cooke of the Cognitive Engineering Research Institute (CERI). Dr. Andrea Heiberg has joined the PALM team to work on this project and her linguistic insight and programming skills have been extremely valuable in advancing Double R. The other members of the PALM team have also been very helpful and pleasant to work with.

At New Mexico State University, Dr. Ken Paap was instrumental in my conversion to a Cognitive Science orientation and welcomed me into his research laboratory. In that laboratory, Ron Noel provided technical assistance in developing the software to run the experiments that were reported in my dissertation, and also engaged me in many interesting discussions during our overlapping tenure in Ken's research laboratory.

In the Computing Research Laboratory at NMSU, Dr. Yorick Wilks created an exciting research atmosphere and provided me a Research Fellowship that allowed me to pursue my research in language processing without encumbrance. He later provided me a Research Assistantship, which allowed me to participate in the Machine Translation research and development of the CRL, primarily in the development of the X-Windows GUI component of a five language MT system. In an attempt to spin off that MT research, Dr. Mike Roseborough engaged me in the development of an English-Japanese Machine Translation system where I had the pleasure of working with Susumo (Duke) Yasudo.

At the University of Florida, I was fortunate to have Dr. Douglas Dankel II serve as my advisor. He introduced me to AI and lit the flame of interest in Machine Translation and Natural Language Processing that has been burning ever since.

These are the primary individuals that have had a direct influence on my research direction and accomplishments. However, there are a myriad of researchers who have made the results of their research available to me and have had a major, if less direct, impact on my research. Among the most important are Ronald Langacker and George Lakoff (Cognitive Linguistics), John Anderson (Propositional Representations, ACT*, and ACT-R), Walter Kintsch (Propositional Representations, Construction-Integration Theory), Ray Jackendoff (*Semantics and Cognition, Foundations of Language*), Charles Fillmore (Case Grammar and Construction Grammar), Talmy Givon (Functional

Grammar), Phillip Johnson-Laird (Mental Models), George Miller and P. Johnson-Laird (Lexical Semantics), John Lyons (*Semantics*), Randolph Quirk et al. (Traditional Grammar), Otto Jespersen (Traditional Grammar) and Terry Winograd (*Language as a Cognitive Process*). In 2003, I had the privilege of traveling with Leonard Talmy (*Cognitive Semantics*) and acknowledge his influence on many of the ideas that have been expounded by others and which have influenced my own research.
